

# OTB python package

---

A dream becoming true ?!

The world is how we shape it\*

# `pip install orfeotoolbox`

**01** | Difficulties

**03** | Expected results

**02** | Howto ?

# Difficulties

- OTB contains:
  - C++ code and libs
  - Swig
  - Superbuild (all OTB dependencies)
- If package is compiled at runtime (like numpy), installation can take 45 minutes (or 4 coffee breaks)

# Howto?

Do what ITK does: using Scikit-build-core

Packaging steps from "pyproject.toml"

- Create an isolated environment, install dependencies, copy needed files: the source tree
- The build-backend (scikit-build-core) runs the actual OTB cmake to compile libs
- A wheel is created with Binary Distribution

# Expected result

- Each wheel must contains libs and python bindings
- Number of wheel is impacted (GLIBC compatibility + python versions supported)

**NUMBER OF WHEELS = number of python versions \* number of glibc to support**

## Where are we?

---

- You can use <https://pypi.org/project/otb/> but it is Orieux Toolbox
- Still prototyping
- Need ITK 5
